

ifo Business Climate Index Falls

Munich, June 24, 2019 - The mood among German company managers has cooled further. The ifo Business Climate Index fell from 97.9 points in May to 97.4 points in June. This is its lowest level since November 2014. Companies have grown increasingly pessimistic about the coming months. However, their assessment of the current business situation improved marginally. The German economy is heading for the doldrums.

In manufacturing, the business climate index fell once again. While the indicator of the current situation is still above its long-term average, it has now been falling for over a year. As to business expectations, last month's ray of light has disappeared. Industrial companies' pessimism grew, due primarily to shrinking order books.

In the services, the business climate worsened, driven by noticeably less optimistic expectations. In contrast, service providers were more positive in their assessment of the current business situation.

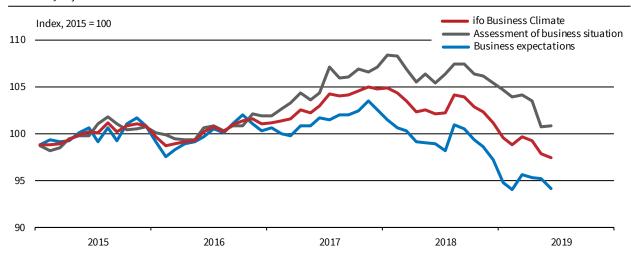

In trade, the index rose. Companies were more satisfied with their current situation. They were also more confident about the coming months. For wholesalers, the improvement was stronger in the index of expectations; for retailers, it was the indicator of the current business situation that rose more.

In construction, the business climate index fell, but remains at a high level. Companies' assessment of their current situation worsened. Their business expectations for the coming six months also fell.

The ifo Business Climate is based on ca. 9,000 monthly survey responses from firms in manufacturing, service sector, trade and construction. The firms are asked to give their assessments of the **current business situation** and their **expectations** for the next six months. They can characterise their situation as "good", "satisfactory" or "poor" and their business expectations for the next six months as "more favourable", "unchanged" or "more unfavourable". The **balance value** of the current business situation is the difference between the percentages of the responses "good" and "poor"; the balance value of the expectations is the difference between the percentages of the responses "more favourable" and "more unfavourable". The **business climate** is a transformed mean of the balances of the business situation and the expectations. For the purpose of calculating the **index values**, the transformed balances are all normalised to the average of the year 2015.

The ifo Business Cycle Clock shows the cyclical relationship between the current business situation and business expectations in a four-quadrant diagram. In this diagram economic activity – shown on a graph plotting the economic situation against expectations - passes through quadrants labelled with the different phases of economic activity, namely upturn, boom, downturn, recession; provided that the expectation indicator sufficiently precedes the current business situation indicator. If survey participants' assessments of the current business situation, and thus of business expectations, are negative on balance, the economic situation indicator moves into the "recession" quadrant. If the expectations indicator is positive (with a poor, but improving business situation on balance), economic activity is shown in the "upturn" quadrant. If the business situation and business expectations are both positive on balance, economic activity enters the "boom" quadrant. If, however, the expectations indicator turns minus (with the business situation remaining good on balance, but deteriorating), economic activity slips into the "downturn" quadrant.

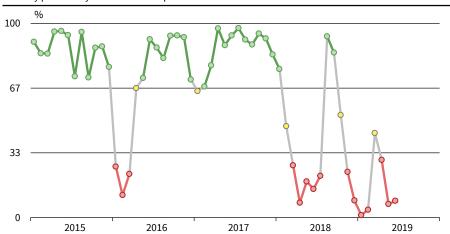

Increases in dispersion measure signals greater uncertainty on the part of firms. Values can range from between 0 and 100. The measure is based on responses to questions related to expectations regarding the six-month business outlook and is generated from the dispersion of these expectations at any given time.

ifo Business Cycle Traffic Lights Germany

Monthly probability for economic expansion^a

^a Green = high, yellow = medium, red = low. Calculated on the basis of the monthly changes

of the ifo Business Climate Index Germany.

Monthly movements of the ifo Business Climate Index Germany can be transformed with the help of Markov Switching Models into probability statements for the two cyclical regimes expansion or contraction. The ifo Business Cycle Traffic Lights provides the monthly regime probabilities for the expansion phase. The probabilities signal an economic expansion (green lights) insofar as they exceed the 66% mark; contractions insofar as they are under the 33% mark (red lights); or indifference (yellow lights) when in the range in between. This indifference interval can be interpreted as a buffer zone between the regimes expansion and contraction, in which particularly great uncertainty exists about the state of the economy.
